

```
curl -X POST -H "Authorization: Basic dX===== " -H "Content-Type: application/json" -d '{"sql":"select * from xxx limit 3;", "project":"xxx" }' http://-----:8000/api
```

```
curl -X POST -H "Authorization: Basic dX===== " -H "Content-Type: application/json" -d '{"sql":"select * from xxx limit 3;", "project":"yyy" }' http://-----:8000/api
```

这两个 api SQL 一样，project 不一样，但是拉取是数据是一样的，按道理有一个 project 应该是拉不了数据

下面的 cube 下线了也能查询数据和拉取数据

Name ↕	Status ↕	Project ↕
account_cube_inst	DISABLED	account_pro

The screenshot shows a data tool interface with a sidebar on the left containing a tree view with 'DWD' and 'account_cube_inst'. The main area has a query editor with the text 'select * from account_cube_inst limit 3;'. Below the editor, there are dropdowns for 'Project: account_pro' and 'Cube: -- Choose Cube --'. A 'Results' section shows two tabs, with the second tab (labeled '2 ✓') selected. Below this, a 'Query String' section shows 'Status: Success' and 'Project: account_pro'. At the bottom, a 'Results (3)' table is displayed with columns 'ID', 'CREATE_BY', and 'CREATE_TIME'. The first row of data shows '0a03605a-d1d...' for ID and '2022-05-11 18:...' for CREATE_TIME.

ID	CREATE_BY	CREATE_TIME
0a03605a-d1d...		2022-05-11 18:...

下线的 cube 依然可以通过 api 拉取数据，可以查询数据，并且拉取数据的 project 不对，依然可以拉取数据
